

APPLICATION — KRISENCHAT

Midlevel Full Stack Engineer

Subject: Application — Midlevel Full Stack Engineer

APPLICATION TEXT

Dear krisenchat team,

I am applying because the role combines the parts of full-stack engineering I prefer: building user-facing Next.js/React features, owning the backend and API implications, and working on a product where reliability and responsible implementation matter.

My recent work includes a Next.js contract-management platform with Google OAuth, MongoDB, PDF processing and Redis-backed functionality; a database-driven customer/admin portal with usage calculations and operational workflows; and responsive PWA/product interfaces. Across those projects I have worked across UI, application logic, persistence, authentication, integration and deployment rather than staying inside a single frontend layer.

I also use AI-assisted development for architecture exploration, implementation, debugging and refactoring, but I treat generated code as engineering input that still needs review, testing and security judgment. That approach is particularly important for a product handling sensitive users and data.

My strongest current stack is JavaScript, Next.js, React, Node.js-style server-side development, MongoDB and OAuth. I am actively strengthening TypeScript and would be prepared to demonstrate that progress in a practical task or technical discussion.

I would welcome the opportunity to discuss how I approach product requirements, feature ownership and responsible AI integration.

Best regards,
Ryan Nyberg

ROLE-SPECIFIC PROOF POINTS

- Next.js/React ownership across multiple full-stack applications.
- Authentication/OAuth and document workflows relevant to privacy-aware product development.
- API/database integration and end-to-end delivery rather than frontend-only work.
- AI-assisted engineering workflow with explicit human review.

BEFORE SENDING

The posting asks for a CS degree or similar and 3+ years in a comparable full-stack role. Confirm that your education/experience history satisfies that wording before you claim it in an application.
